Agnes

We look at thousands of instruments representing equities, major forex pairs, commodities, and indices in a comprehensive manner, whereby we utilize our Artificial Intelligence based Network of Systems to provide signals on well defined short and long term direction and price targets.

We then present this in the form of a dynamic console, SMS service, or CSV API pull to open up the market for the retail trader like never before; no longer will you have to stare at incomprehensible lines on a screen, with no clear idea of what to do, Agnes provides a paint-by-numbers trading plan, liberating you and allowing your money to grow steadily with well-defined equity management rules.

Archimedes

Archimedes is the integration of several of Invacio's AI systems, not only do we utilize Agnes, we build upon it to unleash full AI on the markets. Archimedes is a Friends & Family Macro Experiment (not open to investment by the general public at this time) that is continuously being enhanced, as well as expanding in scope. We are achieving returns on par with leading hedge funds.

Data

If you want information on crop or flooding effects, on ocean effects, on satellite-based derivation of data, on entire economies, on geographies, on macro/micro financial movements, Invacio Data has it all; we're watching from the depths of the oceans to the tip of the Himalayas, from space to the middle of forests. We're watching, and we're deriving actionable intelligence on a macro/micro scale, modelling the effects in real-time to forecast future trends, movements, and impact to all areas. You can access the raw data directly, or receive the processed information, as needed.

Intelligence

Harnessing our all-encompassing analytic capabilities in real time, we track millions of variables, creating real-time intelligence about your market, industry, company, or competition via AI-processed insights for clear and actionable intelligence. Gone are the days when companies had to utilize 3rd party providers that easily missed key information. Intelligence does not miss a beat as it looks at the entire digital ecosphere to extract the necessary data and process it for you. See your intelligence results through an information-rich console or directly through your own systems via our API.

Consumer

Consumer is one of our favorites, we liberate consumers by offering them a more accessible view of products, solutions, and services. No longer constrained to looking through countless pages of self-servingin formation, or comparing through incomplete and biased online comparison tools presented by companies trying to sell you, Invacio does this with full impartiality. Consumer gives you the ability to type a 'name' into the console, where our AI extracts information from the data noise that normally never sees the light of day. We harness this information and paint the truest picture of where the product, or company, really stands against its peers, and what's best is that we do this for free, independent from marketing or commissions. We want to help the individual consumer/user see the reality before handing over their hard earned money.

Aquila

Aquila is the integration of all our financial endeavors into one. Wrapped around our AI, Jean, it opens the market in all its intricacy for timely investment. We look at the global markets with a bird's eye view and identify where to find the best opportunities for returns for accredited investors. Aquila is a Hedge Fund leveraging the most advanced AI with seasoned traders and equity managers, providing risk management and returns, in both up and down markets. Aquila is the crown jewel of Jean's financial capabilities.

API

Our API services is a gateway into our Data and other offerings, providing an easy to use pipeline into Invacio and Jean, from within your corporation. We provide the ability to view data in a different light, with scalability and speed, through some of the most advanced AI and analysis systems on the market today. API lets you integrate your systems to feed off of Invacio's vast storehouse of data, raw and processed, for you to build whatever capabilities you require with absolute freedom. Build whatever your imagination can envision. We have the Data, you have the Power.

Invmail

Our Secure Communications System is built on Zero Knowledge and End 2 End Encryption on the Client side; when we say it's encrypted, we mean it's not only encrypted on our servers, but we do not even know who's sending or receiving, nor who owns each block of data. We are the securest of the secure when it comes to electronic communications.

Network

Our matrix, a fully customizable desktop console providing access to all our services, it is your portal into Invacio. Leave behind the stifling political opinions, unreliable information, vapid conversation flows, generic socializing, archaic financial systems, or easily hacked communications. Invacio Network is the integration of all our back end systems into one user-oriented network console, giving you a unique environment to work and intelligently socialize, professionally and personally. It is built to scale as needed to adapt to your use, and offer non-biased, individually relevant, AI-driven functionality.

Security

Physical security is a thing of the past. If you are not digitally secure today, you will soon be victimized. A quick glance at the headlines any random day will give proof of this. Equifax hacked. Credit card numbers for sale on the Darkweb. Every single one of Yahoo's users, billions of them, had their information hacked and stolen. Security is our fully AI-driven, macro/micro analysing, and spidering, neural based network. We're watching the entire digital datasphere in real time, identifying threats before they are made a reality. From finding mentions of you online, to seeing if any of your private data is at risk or already exposed, all the way to leveraging advanced AI capabilities to "man" security checkpoints and identify and classify people before they get close to you, our analysis capabilities are in many cases unrivalled, and our neural network capabilities are always learning and improving.

Labs

Our experimentation chamber, where we continuously scale out new uses for our AI, carry out research in diverse fields, and open source our findings, code, and opportunities.
